# 3.

# Expressing Knowledge

© Brachman & Levesque 2005

Knowledge engineering

KR is first and foremost about knowledge

meaning and entailment

find individuals and properties, then encode facts sufficient for entailments

Before implementing, need to understand clearly

- what is to be computed?
- why and where inference is necessary?

### Example domain: soap-opera world

people, places, companies, marriages, divorces, hanky-panky, deaths, kidnappings, crimes, ...

### Task: KB with appropriate entailments

- what vocabulary?
- what facts to represent?

### Domain-dependent predicates and functions

main question: what are the individuals? here: people, places, companies, ...

### named individuals

john, sleezyTown, faultyInsuranceCorp, fic, johnQsmith, ...

### basic types

Person, Place, Man, Woman, ...

#### attributes

Rich, Beautiful, Unscrupulous, ...

### relationships

LivesAt, MarriedTo, DaughterOf, HadAnAffairWith, Blackmails, ...

### functions

fatherOf, ceoOf, bestFriendOf, ...

KR & R

© Brachman & Levesque 2005

**Basic facts** 

### Usually atomic sentences and negations

### type facts

Man(john),

Woman(jane),

Company(faultyInsuranceCorp)

### property facts

Rich(john), -HappilyMarried(jim), WorksFor(jim,fic)

### equality facts

john = ceoOf(fic), fic = faultyInsuranceCorp, bestFriendOf(jim) = john

Like a simple database (can store in a table)

### **Complex facts**

#### Universal abbreviations $\forall y [Woman(y) \land y \neq jane \supset Loves(y, john)]$ possible to express $\forall y[\operatorname{Rich}(y) \land \operatorname{Man}(y) \supset \operatorname{Loves}(y, \operatorname{jane})]$ without quantifiers $\forall x \forall y [Loves(x, y) \supset \neg Blackmails(x, y)]$ Incomplete knowledge Loves(jane,john) v Loves(jane,jim) cannot write down which? a more complete version $\exists x [Adult(x) \land Blackmails(x, john)]$ who? **Closure** axioms $\forall x [Person(x) \supset x = jane \lor x = john \lor x = jim \dots]$ $\forall x \forall y [MarriedTo(x, y) \supset ...]$ limit the domain of discourse $\forall x [x=fic \lor x=jane \lor x=john \lor x=jim \dots]$ also useful to have jane $\neq$ john ... © Brachman & Levesque 2005 KR & R 38

### **Terminological facts**

General relationships among predicates. For example:

disjoint	$\forall x[\operatorname{Man}(x) \supset \neg \operatorname{Woman}(x)]$
subtype	$\forall x [\text{Senator}(x) \supset \text{Legislator}(x)]$
exhaustive	$\forall x [\text{Adult}(x) \supset \text{Man}(x) \lor \text{Woman}(x)]$
symmetry	$\forall x \forall y [MarriedTo(x,y) \supset MarriedTo(y,x)]$
inverse	$\forall x \forall y $ [ChildOf( <i>x</i> , <i>y</i> ) $\supset$ ParentOf( <i>y</i> , <i>x</i> )]
type restrict	tion $\forall x \forall y \; [MarriedTo(x,y) \supset Person(x) \land Person(y) \land OppSex(x,y)]$
	Sometimes

Usually universally quantified conditionals or biconditionals

### Is there a company whose CEO loves Jane?

```
\exists x [Company(x) \land Loves(ceoOf(x),jane)] ??
Suppose \mathcal{F} \models KB.

Then \mathcal{F} \models Rich(john), Man(john),

and \mathcal{F} \models \forall y [Rich(y) \land Man(y) \supset Loves(y,jane)]

so \mathcal{F} \models Loves(john,jane).

Also \mathcal{F} \models john = ceoOf(fic),

so \mathcal{F} \models Loves( ceoOf(fic),jane).

Finally \mathcal{F} \models Company(faultyInsuranceCorp),

and \mathcal{F} \models fic = faultyInsuranceCorp,

so \mathcal{F} \models Company(fic).

Thus, \mathcal{F} \models Company(fic) \land Loves( ceoOf(fic),jane),

and so

\mathcal{F} \models \exists x [Company(x) \land Loves(ceoOf(x),jane)].

Can extract identity of company from this proof
```

### **Entailments: 2**

If no man is blackmailing John, then is he being blackmailed by somebody he loves?

```
\forall x[Man(x) \supset \neg Blackmails(x, john)] \supset
                   \exists y [Loves(john, y) \land Blackmails(y, john)] ??
      Note: KB \models (\alpha \supset \beta) iff KB \cup \{\alpha\} \models \beta
Let: \mathcal{J} \models \mathsf{KB} \cup \{\forall x [\mathsf{Man}(x) \supset \neg \mathsf{Blackmails}(x, \mathsf{john})]\}
Show:
                  \Im \models \exists y [Loves(john, y) \land Blackmails(y, john)]
      Have: \exists x [\operatorname{Adult}(x) \land \operatorname{Blackmails}(x, \operatorname{john})] and \forall x [\operatorname{Adult}(x) \supset \operatorname{Man}(x) \lor \operatorname{Woman}(x)]
                  \exists x [Woman(x) \land Blackmails(x, john)].
          SO
          Then:
                           \forall y[\operatorname{Rich}(y) \land \operatorname{Man}(y) \supset \operatorname{Loves}(y, \operatorname{jane})] and \operatorname{Rich}(\operatorname{john}) \land \operatorname{Man}(\operatorname{john})
          SO
                  Loves(john,jane)!
          But: \forall y [Woman(y) \land y \neq jane \supset Loves(y, john)]
          and \forall x \forall y [Loves(x, y) \supset \neg Blackmails(x, y)]
                  \forall y[Woman(y) \land y \neq jane \supset \negBlackmails(y,john)] and Blackmails(jane,john)!!
          SO
          Finally: Loves(john, jane) ^ Blackmails(jane, john)
          so: \exists y [Loves(john, y) \land Blackmails(y, john)]
```

## Sometimes useful to reduce n-ary predicates to 1-place predicates and 1-place functions

- · involves reifying properties: new individuals
- typical of description logics / frame languages (later)

### Flexibility in terms of arity:

Purchases(john,sears,bike) or Purchases(john,sears,bike,feb14) or Purchases(john,sears,bike,feb14,\$100)

Instead: introduce purchase objects

Purchase(p)  $\land$  agent(p)=john  $\land$  obj(p)=bike  $\land$  source(p)=sears  $\land$  ... allows purchase to be described at various levels of detail

Complex relationships: MarriedTo(x,y) vs. ReMarriedTo(x,y) vs. ...

Instead define marital status in terms of existence of marriage and divorce events.

 $Marriage(m) \land husband(m) = x \land wife(m) = y \land date(m) = ... \land ...$ 

KR & R

© Brachman & Levesque 2005

### **Abstract individuals**

Also need individuals for numbers, dates, times, addresses, etc.

objects about which we ask wh-questions

Quantities as individuals

```
age(suzy) = 14
```

age-in-years(suzy) = 14 age-in-months(suzy) = 168

perhaps better to have an object for "the age of Suzy", whose value in years is 14

years(age(suzy)) = 14

months(x) = 12\*years(x)

centimeters(x) = 100\*meters(x)

#### Similarly with locations and times

```
instead of
time(m)="Jan 5 2006 4:47:03EST"
```

can use

time(m)= $t \land year(t)=2006 \land ...$ 

### Statistical / probabilistic facts

- Half of the companies are located on the East Side.
- Most of the employees are restless.
- Almost none of the employees are completely trustworthy,

### Default / prototypical facts

- Company presidents typically have secretaries intercepting their phone calls.
- Cars have four wheels.
- Companies generally do not allow employees that work together to be married.

### Intentional facts

- John believes that Henry is trying to blackmail him.
- Jane does not want Jim to think that she loves John.
